

Brightledger

Seed-Stage Pitch Deck (fictional, for Milestone 4 testing)

Problem & Solution

Mid-market logistics companies reconcile freight invoices by hand against bills of lading and rate confirmations -- a process that commonly takes 3-5 finance-team hours per week per active lane.

Brightledger automates this reconciliation end to end, matching carrier invoices against contracted rates and flagging discrepancies for human review instead of requiring line-by-line manual checks.

Product & Technology

Architecture: cloud-native on AWS, containerized services orchestrated via Kubernetes (EKS).

Backend: Python / FastAPI services behind an API gateway.

Data layer: PostgreSQL (system of record) + Redis (caching, rate limiting).

Document ingestion: a custom OCR + rules-based parser for carrier invoice PDFs and EDI 210/214 feeds.

Security: SOC 2 Type I audit currently in progress, targeting completion within two quarters; no completed certification yet.

Competitive Landscape

Named competitors: Tipalti (AP automation, broader scope, higher price point) and Bill.com (general AP/AR, no freight-specific matching logic).

Internal analysis of our current sales pipeline shows roughly 70% of prospective mid-market customers still reconcile freight invoices manually in spreadsheets today -- the primary substitute we compete against is not another vendor, but the status quo of manual Excel-based reconciliation.

Team & Funding Ask

Both co-founders (CEO, CTO) are first-time founders.

CTO previously led a 4-person engineering team at a prior startup (pre-Series A); this is her first time scaling an engineering org past that size.

Raising a \$2.5M seed round at a \$12M pre-money cap, primarily to fund 3 additional engineering hires and a first dedicated customer success role.
